Imaging Systems for Medical Applications

Telehealth

General Teleconferencing

Sony offers teleconferencing products that can be used for basic conferencing plus simple consultations. Education and training are other practical applications.

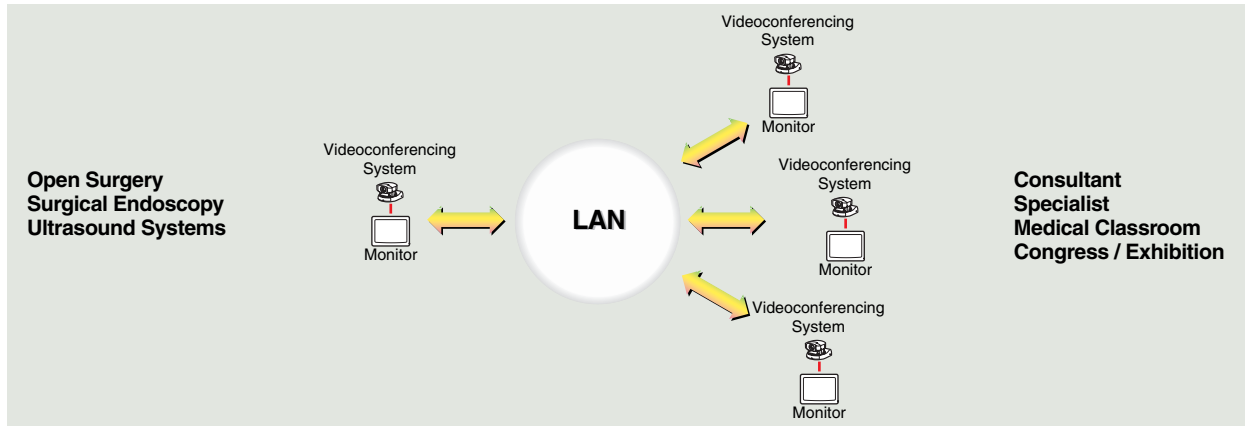

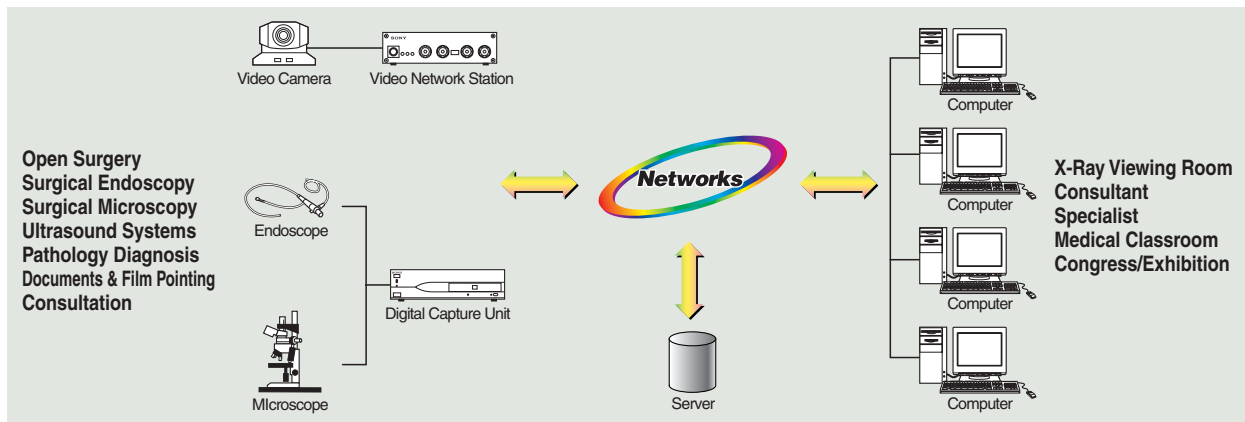

Image Sharing Over Networks

The Sony video network station and digital capture unit allows images obtained from a variety of medical equipment to be shared over a network. By connecting this system to a network, multiple users can view images from remote PCs running a standard Internet browser. With its flexible and scalable functions, the Sony video network station and digital capture unit is ideal in a wide range of medical fields.

Ultrasound

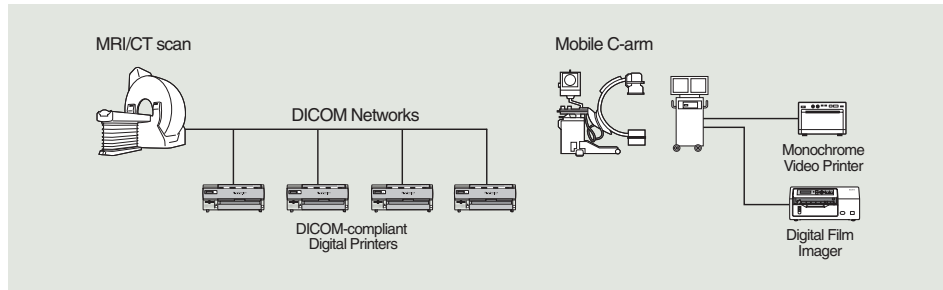

Sony provides the finest high-resolution monitors, a range of VTRs and a digital capture unit for viewing, recording and sharing clear images obtained from ultrasound equipment, thus enabling accurate diagnosis and analysis. Highly detailed, economically priced, hard copies of on-screen images are provided within seconds by a printer from the sony product line-up.

Radiology

Sony offers a wide range of printers to capture the precise images put out by X-ray diagnostic systems. Images obtained from MRI, CT scan, and Mobile C-arm applications are reproduced by these printers at high speed, and with superior image quality. A DICOM*-compliant Sony digital film imager is also available, enabling you to easily print diagnostic images from the modalities connected to the DICOM network.

* DICOM (Digital Imaging and Communication in Medicine) is the official standard of the ACR (American College of Radiology) and NEMA (National Electrical Manufacturers Association).

Endoscopy

Sony compact and lightweight CCD video cameras are suitable for endoscopic examinations. High-resolution monitors are used to display incredibly clear and true-to-life images, allowing several physicians to participate in the examination, conferring to make a more accurate diagnosis. High-quality color still images can be obtained from the printer. A Sony VTR or digital capture unit can also be used to store images for later viewing.

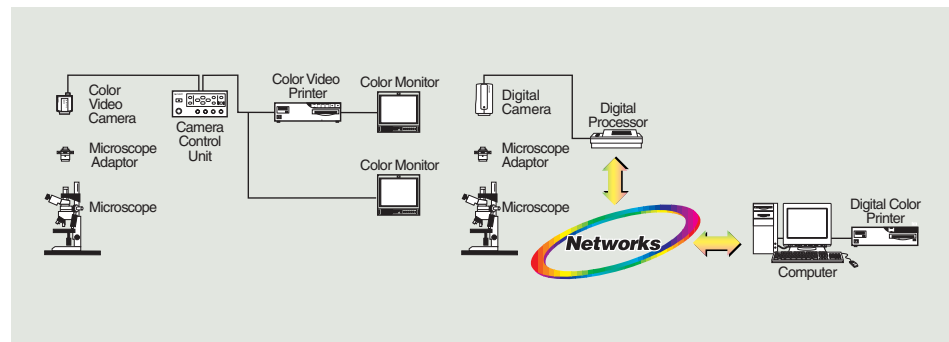

Dental

Sony compact video cameras are suitable for intra-oral applications. VTRs, video monitors and still recorders can be used to store and monitor the captured images. For dental X-ray, multiscan monitors and digital graphic printers are available.

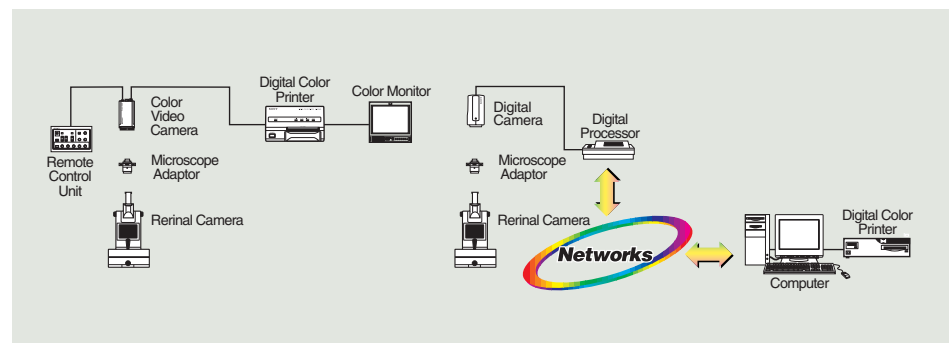

Pathology

The combination of Sony high-performance color video cameras and high-resolution monitors allows the display of tissue in lifelike colors as viewed through a microscope. These images can also be easily printed out using a color video printer. High-resolution digital images can be obtained by Sony digital camera for a workstation-based digital pathology system.

Ophthalmology

The combination of Sony high-performance color video cameras and high-resolution monitors enables detailed images to be displayed from various optical devices. These images can also be easily printed out using a color video printer. High-resolution digital images can be obtained by a Sony digital camera for a workstation-based digital ophthalmology system.

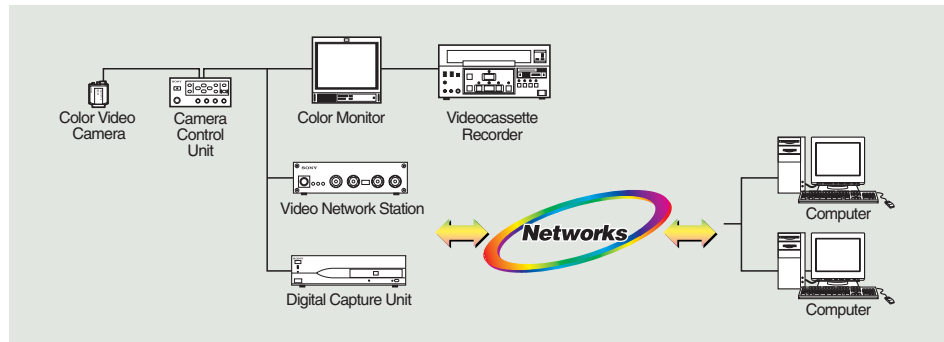

Microsurgery

Sony compact, high-performance CCD video cameras offer excellent surgical support when connected to operation microscopes. Images captured can be displayed on a high-resolution monitor so that the surgical team in the operating theater can view details of the operation as seen under the operation microscope. At the same time, these high-quality images can be recorded on a Sony high-resolution VTR or a Sony Digital Capture Unit for later viewing. The Sony line of color video printers can also reproduce quick, high-quality hardcopy prints. The recording of microsurgery procedures is beneficial for medical education and for presentations at medical conferences.

Operating Theater Monitoring

The combination of Sony video cameras, color monitors and VTRs allows the overall view of surgical procedures in an operating theater to be recorded. This recorded material is useful for conferences and medical education. By adding a Sony video network station or digital capture unit to the system, the recorded images can be viewed by multiple users and at multiple locations through a network.

Patient Monitoring

Sony monitors provide reliable patient monitoring systems at bedside and in monitoring centers. Each monitor lets physicians keep continuous watch on patients physiological information.
