

590

PHASE MANIPULATOR

HIGHLIGHTS ■

POLARITY INVERT SWITCH

180-DEGREE VARIABLE PHASE CONTROL

LOW-CUT FILTER

The dbx 590 is a 500 Series phase manipulation tool designed to correct problematic audio phase alignment when recording multiple signal sources. A high-quality analog device, the 590 helps deliver smooth, natural-sounding phase curves and adds warmth to your recordings. Simple to use, the variable phase control knob and switchable low-cut filter puts you in control of audio phase manipulation.

500 Series are a family of processing modules for use in studio, live sound and mobile recording applications. Because they are compact, portable and highly modular, they are a perfect choice for adding precise tools to your rig without spending a fortune. They also offer excellent features, control, sound quality and the highly sought-after warmth and usability of analog signal processing.

KEY MESSAGES ■

LEGENDARY PERFORMANCE

The new dbx 500 Series modules are based on heritage dbx technologies that are still in use in major studios worldwide today. Examining the original schematics and components, the 500 Series offers users the sound quality that they are used to on dbx analog products, with upgrades for reliability, ease of use and component quality.

MODULAR + PORTABLE

500 Series modules offer the exactly the control and processing that you need to shape your sound perfectly. With flexible power and transport options, you can select the modules you need and use them with a variety of rack mounted and standalone power units from dbx. All 500 Series modules and power units are also compatible with other manufacturers' 500 Series products.

IN THE BOX ■
