# NSI DIGITAL DIMMING SYSTEM DDS 6000 DIMMER PACK INSTALLATION AND OPERATION GUIDE 

## Software Revision 1.0 and above, Version C, UL Versions

## INTRODUCTION

The NSI DDS 6000 represents a key part of a state of the art, integrated lighting control system. These dimmers may operate in a "stand alone" mode for automated lighting of displays or may be combined with an NSI memory lighting console for total lighting control. The DDS 6000 provides four channels of 1200 watts each. This dimmer is designed for portable or permanent use for entertainment or display lighting. Several DDS dimmer packs may be combined for more channels of lighting.

## SPECIFICATIONS

Number of Channels:
Output capacity:
Input Power:

Dimmer control system:

Load filtering:
Control Input Types:

Control Wiring:

Output Connections:

Cooling System:
Ambient Temperature:
Load Type:
Enclosure Type:

4

1200 Watts per channel.
DDS 6000-15: 120 VAC 1800 Watts max (one power source) DDS 6000-20: 120 VAC 2400 Watts max (one power source) DDS 6000Plus-15: 120 VAC 3600 Watts max (two power sources) DDS 6000Plus-20: 120 VAC 4800 Watts max (two power sources)

Microprocessor digital phase control dimming or zero-crossing relay mode.
$\sim 400$ us rise time.
$0-10 \mathrm{VDC}$ each channel on 5 pin Din connector.
MICROPLEX multiplex signal (128 channel) on three pin XLR type connector.

DMX-512 digital signal (512 channel) on five pin XLR optional.
Class 2 low voltage.

2 NEMA 5-15 outlets per channel.
Screw terminals optional
Passive external aluminum heatsinks.

100 degree F Maximum.
AC lighting loads only
For indoor use only, (Utilizer dans un endroit a l'abri.)

## MOUNTING

The NSI DDS 6000 dimmer pack is designed to be mounted VERTICALLY. Each dimmer pack is provided with two mounting flanges or ears designed for securing to the center of truss bars or attaching to other vertical surfaces. Since the DDS 6000 depends upon convection cooling, room air flow must be insured. Keep the air vents located on front and each side of the dimmer pack clear of dust or any obstructions. In order for the unit to cool properly the control receptacles must be oriented towards the floor. If several units are to be operated in a small enclosed room, adequate ventilation must be provided to prevent the room temperature from exceeding 100 degrees Fahrenheit

## AC POWER CABLE(S) - PORTABLE CONNECTION

This is the main power cord(s) for your dimmer pack which ultimately carries all of the ac power consumed by lights connected to the dimmer pack. The DDS6000 with the NEMA $5-15$ plug is limited to 1800 watts max. While the unit with NEMA 5-20 plug will support 2400 watts. The DDS6000 Plus includes two cords, one per each two channels, which doubles the maximum capacity. The power cord(s) must be connected to a power source capable of supplying the total power drawn by the lights. (See specifications for details on maximum power capability.)

WARNING: Do not remove grounding prong of AC plug. To do so may allow exposure to potentially lethal voltage levels and will void the warranty on this product.

## AC OUTPUT RECEPTACLES

The DDS 6000 has two AC receptacles for each channel. These receptacles provide power to the lamps in your lighting system. The amount of power supplied to these outlets controls the intensity of the lamps connected.

The total lamp wattage connected to each channel must not exceed the rating of each channel (see specifications). For inductive loads, the total lamp volt-amperes plus the volt-amperes of any ballast or transformer must not exceed the rating of each channel.

NOTE: Some inductive type loads such as transformers, ballasts, and motors, with poor power factor may cause the dimmer to output D.C. type current. This may cause the load to draw excessive current and overheat, causing damage to the
transformer, ballast, or motor. For this reason, it is necessary to insure any inductive loads are fused individually for their respective normal operating current.

## PERMANENT CONNECTION

The DDS6000 is available as an optional DDS6000 Plus-20 terminal version. This version must be installed by qualified personnel in accordance with applicable electrical codes.

## AC Input

Conduit containing line conductors enters pack through one of the knock-outs in the top end. The two 20A, 120V, 60 HZ , 2 wire line circuits, A and B , are terminated to their respective terminals labeled Line and Line N . The terminals accept wire sizes 22-8 AWG CU and have a torque rating of 8 in-lbs. Line equipment grounding conductor, if a wire, terminates to the lug labeled Gnd. The ground lug accepts wire size 14-6 AWG CU and has a torque rating of 35 in-lbs. (14-10 AWG), 40 in-lbs. (8 AWG), and 45 in-lbs. (6 AWG).

## AC Output

Conduit containing load conductors enters pack through on of the knock-outs in the top end. The four 1200W max, 120V, 2 wire load circuits, 1 through 4, are terminated to their respective terminals labeled Load and Load N. Circuits 1 and 2 are supplied from input A, and circuits 3 and 4 from input B. The control power supply is also supplied by input A. Terminal rating are the same as indicated above for line terminals.

## MICROPLEX MULTIPLEX CONTROL WIRING.

Microplex is the control protocol used on most NSI lighting consoles. This system uses a single three conductor cable to transmit up to 128 channels of dimmer control. For short distances ( 50 feet or less) a standard microphone cable may be used to carry both the control signal and the DC power source for NSI control consoles. Longer distances may be accommodated with 18 gauge or better cable to reduce voltage losses of the power supply.

Connect the Microplex control cable to either of the three pin XLR jacks. Since both jacks are wired in parallel, another control cable may connected between the remaining jack and another dimmer pack. Many dimmer packs may be "daisy chained" together in this manner.

Be sure to set the Channel Address dip switch as required (see DIP SWITCH SETTINGS).

## ANALOG 0-10 VDC CONTROL WIRING.

Each of the four dimmer channels of the DDS 6000 may be operated by an analog 0-10 VDC control voltage. This type of control will provide $0 \%$ intensity at 0 volts and $100 \%$ intensity at 10 volts. Any or all of the DDS 6000 dimmer channels may be operated in this manner simultaneously with any multiplex control input. Each dimmer will respond to the greater of any control inputs.

The analog control input uses a standard 5 pin DIN plug which is available from most electronics supply houses. Connect each of the positive channel control wires to the desired dimmer channel input pins (see diagram) of the plug. Connect the common (ground) control wire to the pin indicated on the diagram. Consult the documentation of the analog control console or device you are using for the proper connections. The control input impedance is 4.7 K ohms.

## DMX-512 MULTIPLEX CONTROL WIRING.

DMX 512 is the United States Institute of Theater Technology (USITT) standard for the digital control of dimmers. NSI DDS Dimmer products can be converted from Microplex to DMX 512 digital multiplex with a simple kit available from your dealer.

DMX-512 is the preferred type of control wiring when many dimmer channels are used, because of the high update rate and the resistance to interference. It is recommended in locations subject to electrical noise. DMX-512 only requires 3 wires to transmit lighting levels for as many as 512 dimmer channels. Most of the NSI lighting control consoles can optionally use this interface.

Connect the DMX 512 cable from the control console to the male input connector. Another cable may be connected from the female connector to the male connector on another pack. Many dimmer packs may be "daisy chained" connect together in this manner.

Be sure to set the Channel Address dip switch as required (see DIP SWITCH SETTINGS).

## LED INDICATORS

The front panel indicator LEDs indicate the status of the dimmer.

- RED - Indicates the firing card is receiving DC power.
- GREEN - Steady indicates a multiplex control signal is being received.
- YELLOW - Indicates a respective dimmer channel is active and the LED indicates relative intensity.

## AUTO LAMP TEST

Whenever dipswitch \#8 is in the off (down) position and there is no multiplex signal detected, all channel outputs will come to full intensity. The automatic sequencing feature must be disabled for this Auto Lamp test to operate (see INTERNAL CONFIGURATION DIPSWITCH SELECTIONS).

## CHANNEL FUSES

Each channel is protected by a fuse to help prevent overload and damage to the power control devices used in the dimmer. Be sure to replace the fuse with the same type and rating. Replacement with the wrong fuse is dangerous and will void your warranty.

Note: Lamps may sometimes cause a temporary "short-circuit" when the filament burns out and cause the fuse to blow. This is normal and protects the internal dimmer circuitry from damage.

## INSTALLATION and OPERATION TIPS

## Care should always be taken to:

1) Keep all AC wiring away from control wiring.
2) We also recommend powering up and performance checks be done one unit at a time. This can be a real time saver should problems arise thus eliminating unnecessary isolation techniques to resolve problems.

## FRONT PANEL DIP SWITCH SETTINGS

When using any of the multiplex control systems the dip switches on the front panel of the DDS 6000 must be set to assign the desired dimmer channels. The switches control the dimmer channels in groups of four. See the following chart for settings.

DIP SWITCH CHANNEL ASSIGNMENTS

| CONTROL | 1234567 | CONTROL | 1234567 | CONTROL | 1234567 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $1-4$ | 0000000 | $5-8$ | 1000000 | $9-12$ | 0100000 |
| $13-16$ | 1100000 | $17-20$ | 0010000 | $1-24$ | 1010000 |
| $25-28$ | 0110000 | $29-32$ | 1110000 | $33-36$ | 0001000 |
| $37-40$ | 1001000 | $41-44$ | 0101000 | $45-48$ | 1101000 |
| $49-52$ | 0011000 | $53-56$ | 1011000 | $57-60$ | 0111000 |
| $61-64$ | 1111000 | $65-68$ | 0000100 | $69-72$ | 1000100 |
| $73-76$ | 0100100 | $77-80$ | 1100100 | $81-84$ | 0010100 |
| $85-88$ | 1010100 | $89-92$ | 0110100 | $93-96$ | 1110100 |
| $97-100$ | 0001100 | $101-104$ | 1001100 | $105-108$ | 0101100 |
| $109-112$ | 1101100 | $113-116$ | 0011100 | $117-120$ | 1011100 |
| $121-124$ | 0111100 | $125-128$ | 1111100 | $129-132$ | 0000010 |
| $133-136$ | 1000010 | $137-140$ | 0100010 | $141-144$ | 1100010 |
| $145-148$ | 0010010 | $149-152$ | 1010010 | $153-156$ | 0110010 |
| $157-160$ | 1110010 | $161-164$ | 0001010 | $165-168$ | 1001010 |
| $169-172$ | 0101010 | $173-176$ | 1101010 | $177-180$ | 0011010 |
| $181-184$ | 1011010 | $185-188$ | 0111010 | $189-192$ | 1111010 |
| $193-196$ | 0000110 | $197-200$ | 1000110 | $201-204$ | 0100110 |
| $205-208$ | 1100110 | $209-212$ | 0010110 | $213-216$ | 1010110 |
| $217-220$ | 0110110 | $221-224$ | 1110110 | $225-228$ | 0001110 |

|  | $505-508$ | 0111111 | $509-512$ | 1111111 |  |
|  |  |  |  |  |  |

When the automatic sequencing feature is operating, the dip switch selects the operating sequence pattern and speed. See the section on INTERNAL CONFIGURATION DIPSWITCH SELECTION for details.

## INTERNAL CONFIGURATION DIPSWITCH SELECTIONS

## Caution: The follow procedures should be performed by qualified personnel only.

Remove all power and remove the cover of the dimmer pack. Locate and change configuration dipswitch settings on the firing card as indicated in the following section.

## Softstart

The Softstart mode of operation forces at least a $1 / 10$ th second delay between the output being full off to the output being full on to allow a more gradual warming of the lamp filaments. Thermal shock and inrush currents are reduced thereby increasing lamp life. Softstart should not be used when quick dimmer response is desired such as chasing.

To activated Softstart turn OFF switch number one (1) on the configuration dipswitch on the firing card. moving this switch to ON will deactivate Softstart.

NOTE: The channels of the DDS 6000 configured for NON DIM operation will not be affected by softstart.

## Non Dim Channels (Relay Mode)

Any of the channels of the DDS 6000 may be configured as NON DIM channels. This will cause the output of the channel to go to full on whenever the input signal is over $15 \%$. When the input signal drops to less than $10 \%$, the channel output goes to full off. This is the equivalent of a zero-crossing solid state relay.

To configure a channel for NON DIM operation simply move the respective switches on the configuration dipswitch to the OFF position on the firing card as indicated. Moving the switch to ON will restore dimming operation.

| CHANIEL | SWITCHTNUMBER | CHANINEL | SWITCHTNUMBER |
| :---: | :---: | :---: | :---: |
| 1 | 3 | 2 | 4 |
| 3 | 5 | 4 | 6 |

## Auto Sequencing Mode

The DDS 6000 dimmers can be configured to perform stand alone Automatic Sequencing in place of Auto Lamp Test. This is useful for lighting displays and show windows. The four channels will automatically fade from one to another in a preprogrammed pattern and time selected by the front panel dipswitch whenever front panel dipswitch \#8 is up and no multiplex signal is detected. The Analog control input will continue to operate while the dimmer is sequencing.

To enable Automatic Sequencing Mode move the switch on the internal configuration dipswitch \#2 to OFF.
Front panel Dipswitch sequence settings. (not internal dipswitch)

| STEP TIME | SWITCH 1,2,3 | PATTERN | SWITCH 4,5,6 |
| :--- | :---: | :---: | :---: |
| 1 SECOND | OFF,OFF,OFF | 2 CHAN BUILD | OFF,OFF,OFF |
| 3 SECOND | ON,OFF,OFF | 3 CHAN SEQUENCE | ON,OFF,OFF |
| 5 SECOND | OFF,ON,OFF | 3 CHAN BUILD | OFF,ON,OFF |
| 10 SECOND | ON,ON,OFF | $2 \& 4$ CHAN ALT | ON,ON,OFF |
| 15 SECOND | OFF,OFF,ON | 4 CHAN SEQUENCE | OFF,OFF,ON |
| 30 SECOND | ON,OFF,ON | 4 CHAN BUILD | ON,OFF,ON |
| 45 SECOND | OFF,ON,ON | 4 CHAN BUILD + | OFF,ON,ON |
| 60 SECOND | ON,ON,ON | 4 CHAN RANDOM | ON,ON,ON |

Dipswitch \# 7 on causes all above sequences to ping-pong.

## Service Information

## WARRANTY

## NSI Corporation Limited Warranty

NSI Corporation warrants new electronics products to be free from defective materials and workmanship for a period of one (1) year from the date of purchase to the original owner when purchased from an authorized NSI dealer.

The purchaser is responsible for completing and mailing to NSI, within 15 days of purchase, the warranty registration card enclosed with each product. NSI products that have been subject to accident, alteration, abuse, or defacing of the serial number are not covered by this warranty. The normal wear and tear of items such as knobs, jacks, and switches are not covered under this warranty.

If your NSI product requires service during the warranty period, NSI will repair or replace, at its option, defective materials provided you have identified yourself as the original owner of the product to NSI or any authorized NSI dealer. Transportation charges to and from an authorized dealer or the NSI factory for repair shall be the responsibility of the owner. All products returned to NSI must have factory authorization for return prior to shipping.

NSI Corporation is not liable for any incidental or consequential damages resulting from defect or failure other than repairs of the NSI product subject to the terms of this warranty. This warranty gives you specific legal rights, and you may have other rights which vary from state to state. This warranty is expressly in lieu of all other agreements and warranties expressed or implied except as may be otherwise required by law.
