

High-quality Recording and Playback System with No Moving Parts

With its established track record and excellent reputation the AR series has become the de facto standard.

Maintenance free because it uses a PC card for recorded media, it also uses the RDAC system, which allows high quality recording while creating minimal data.

Given these virtues, the AR series is used in many applications, including theme parks, broadcasting stations, and in transportation facilities.

The new AR-3000/200 contains new features such as higher quality recording and playback, and the ability to synchronize with external devices such as video decks and lighting systems. This is Roland's answer to the high level requests of users in many fields who have already implemented the AR series.

Option

- AR-NT1 Network Board (for AR-3000 only)
This board allows you to add networking capability for such operations as remote operation and data transferring.
- RSC-15APL
Dedicated AR-LINK cable. Used when setting up simultaneous recording and playback with multiple AR units.
