

INOGENI

# INOGENI TOGGLE

## User guide

Version 1.7

1/7/22

## VERSION HISTORY

Version	Date	Description
1.0	April 9, 2021	First release
1.1	May 20, 2021	Update RS232 commands section. Change « HOSTx » for « PCx ».
1.2	June 15, 2021	Adding block diagram.
1.3	June 22, 2021	Add GPIN level mode.
1.4	August 27, 2021	Adding more detailed RS232 communication explanations.
1.5	September 13, 2021	Adding more detailed RS232 communication explanations.
1.6	November 8, 2021	Add button lock status (LEDs) with firmware 1.3.
1.7	January 7, 2022	Add RS232 connection diagram.

## TYPICAL APPLICATION

Here is a typical connection diagram used for the TOGGLE device in a videoconferencing setup.

## BLOCK DIAGRAM

Here is a simple block diagram of the TOGGLE unit.

## DEVICE INTERFACES

Here are the devices interfaces.

- ① RS232 and GPI interfaces
- ② 3 x USB-A ports for devices
- ③ PC #1 USB-B port
- ④ PC #2 USB-B port
- ⑤ Push-button
- ⑥ +12V power input
- ⑦ PC #1 led indicator
- ⑧ PC #2 led indicator
- ⑨ Power indicator

## LEDS BEHAVIOR

Here are the leds behavior:

PCx LEDs	
<b>OFF</b>	No PC connected.
<b>SOLID</b>	PC currently selected.
<b>ONE HOST BLINK</b>	PC detected but not currently selected.
<b>BOTH HOST BLINK</b>	User pushed the button, but the button is locked. Please see SCLK command.
Power LED	
<b>OFF</b>	No power present on board.
<b>SOLID</b>	Power detected.
<b>BLINK</b>	Over-current detected on USB devices.
<b>LED Intensity</b>	FULL intensity if power is provided through external power supply. MEDIUM intensity if power is provided through USB connections (PC1 or PC2).

**IMPORTANT: If all leds are blinking in sync, this means the unit is in the upgrade process. This happens only while you upgrade the unit.**

## OPERATING MODES

There are two modes supported by the device. They will be explained here.

### Automatic

This is the default mode. This mode will switch automatically to the last PC<sup>1</sup> connected. If the current PC is disconnected, the device will switch back to the other PC if it is detected. Push-button action and remote control are also supported.

### Manual

The manual mode will enable you to force a specific PC selection. Push-button action and remote control are also supported. It is possible to turn OFF both PCs in manual mode.

These modes can be set through our INOGENI Control App or through the RS232 interface. The mode will be saved onboard the device.

<sup>1</sup> PC: any host computer or laptop.

## SPECIFICATIONS

Here is the complete specification.

Physical details	
<b>Dimensions (W x L x H)</b>	70 x 83 x 23 mm
<b>Power supply</b>	12V
<b>Power consumption</b>	Up to 1.2A
<b>Weight</b>	113 g
<b>Package content</b>	2 x USB 3.0 Type-B to Type-A cables. 1 x terminal block connection. 1 x 12V power supply.
<b>Operating temperature</b>	0° to 45° C (32° to 113° F)
<b>Storage temperature</b>	-40° to 105° C (-40° to 221° F)
<b>Origin</b>	Canada
<b>Warranty</b>	2 years
General specifications	
<b>USB host ports</b>	2 x Type-B USB 3.0/2.0 compatible.
<b>USB device ports</b>	3 x Type-A USB 3.0/2.0 compatible.
<b>Serial interface</b>	Baud rate: 9600 For control purpose. See <b>Serial communication protocol</b> section for more details.
<b>Push-button</b>	Physical switch to select host.
<b>GPIN</b>	Contact-closure control. Controlled by open-drain IO (short to ground) or driven IO. Supported voltage range: 0V to +12V max. Voltage threshold is 0.7V for HW revision 2.0. Voltage threshold is 2.3V for HW revision 3.0+ <sup>2</sup> .
<b>Device current limit</b>	1.8A shared current limit for all 3 x USB device ports. You can monitor current consumption through RS232 and our Control App.
Software	
<b>Upgrade</b>	Field upgradable through our INOGENI Control App.
<b>Control</b>	Automatic, manual or remote control. Current configuration is saved onboard.

<sup>2</sup> Please use the Control App from INOGENI to identify the hardware revision of your product.

## SERIAL COMMUNICATION PROTOCOL

Here is the complete list of commands provided through the serial connection. Pinout is indicated on the enclosure.

**Baud rate: 9600 // Data bits: 8 // Stop bits: 1 // Parity: None // Flow control: None**

Commands	Arguments	Return	Function description
<b>FW</b>	NA	"FW_VER:X.Y" where X = MAJOR and Y = MINOR version.	Get firmware version.
<b>SLCK</b>	0,1	NA	Set/unset button LOCK
<b>GLCK</b>	NA	0,1	Get button LOCK status.
<b>SH</b>	0,1,2	NA	Select PC. 0=OFF 1=PC1 2=PC2
<b>GH</b>	NA	0,1,2	Get PC selected. 0=OFF 1=PC1 2=PC2
<b>GCAUSE</b>	NA	"HOST_OFF" "HOST_CHG" "BTN" "CMD"	Get last PC switching cause: - <b>HOST_OFF</b> : No inputs selected. PC selection process is changing between PC1 and PC2 or both hosts are OFF. - <b>HOST_CHG</b> : PC1 or PC2 appeared / disappeared in mode AUTO; - <b>BTN</b> : Button has been used to change PC selection. - <b>CMD</b> : RS232 command has been used to change PC selection.
<b>GHV</b>	1,2	"X.YZV" Where X = units value YZ = decimal value	Get PCx voltage.
<b>GDI</b>	1,2,3	"X.YZA" Where X = units value YZ = decimal value	Get device X current.
<b>SGMOD</b>	0,1	NA	Set GPIN mode: (pulse = '0', level = '1')

<b>GGMOD</b>	NA	0,1	Get GPIN mode (pulse = '0', level = '1')
<b>GHPW</b>	1,2,3	0,1	Get HUB power status. If report '0', then the HUB had turned OFF the specified USB port (overcurrent).
<b>SAVE</b>	NA	NA	Save settings.
<b>SEV</b>	0,1	NA	Set/clear events (prints).
<b>SM</b>	0,1	NA	Set/clear manual mode.(auto='0', manual='1')
<b>GM</b>	NA	0,1	Get manual mode status.
<b>DEF</b>	NA	NA	Force factory default settings
<b>RST</b>	NA	NA	Reset MCU.
<b>H</b>	NA	List of all commands	Get user help.

You need to add a carriage return character “\r” at the end of the command string.

All commands **without return values** will append 2 possible answers: “**ACK\r**” or “**NACK\r**”.

All commands **with return values** will return the following pattern:

- If command is recognized: “[value]\r**ACK\r**”
- If command is not recognized: “**NACK\r**”

**NOTE:** The user needs to put a **space character between the command name and argument**. For example, when user wants to choose HOST#2, you need to send “**SH 2\r**” to the device. Please note the space character.

## GPIN MODE

With the introduction of firmware 1.1+, there are two (2x) GPIN modes: **pulse** mode and **level** mode.

- The GPIN **pulse** mode is the factory default. Each transition from HIGH to LOW on GPIN pin will force a PC change. See the following picture for the explanation of the mode.

Figure 1 : GPIN Pulse Mode

- The GPIN **level** mode uses a level “0” (short to ground) and “1” (open or voltage higher than threshold) to select a specific PC.
  - o A level “0” or short to ground: PC2 is selected.
  - o A level “1” or open: PC1 is selected.

## IMPORTANT NOTES ABOUT GPIN

- It is recommended to set the Toggle in **manual mode** with the UART command “**sm**” when using the GPIN (especially with level mode). If the Toggle is used in auto mode, any changes on the PCx side will affect the PC selected even if the GPIN level mode is used.
- It is also recommended to lock the button with the UART command “**slck**” when the GPIN is used in level mode.
- For Toggle with a hardware revision of 2.0, you need to connect the external power supply to use the GPIN. The Control App software from INOGENI will report the exact hardware revision.

## SETTINGS

Some settings can be saved with the “**SAVE**” command. These settings are:

- Presence or absence of **events** on serial ports. Events are used for **diagnostic**. An event returned by the unit always starts with the string “**EVT:**” The “**SEV**” serial command is used to enable/disable the events. *This command also automatically saves this setting inside the device.*
- **Manual** or **automatic** mode for PC selection. The “**SM**” command is used to switch between manual and automatic modes. *This command also automatically saves this setting inside the device.*
- If manual mode is selected and the GPIN level mode is disabled: the specific PC selected is also saved. The “**SH**” command is used to select between PC1, PC2 or OFF. *This command also automatically saves this setting inside the device.*
- If the **button is locked or not**. The “**SLCK**” command is used to select between these modes. *\*This command also automatically saves this setting inside the device with firmware 1.3+.*
- If the **GPIN** level mode is selected or not. The command “**SGMOD**” is used to select between these modes. *\*This command also automatically saves this setting inside the device with firmware 1.3+.*
- The “**DEF**” command restores the default settings of the device. It will take effect immediately. The factory default settings are:
  - 1) No events.
  - 2) Automatic mode for PCx selection.
  - 3) GPIN\_LEVEL disabled.
  - 4) Button unlocked.
- The user can change settings with both the serial port commands and with the **ControlApp** (see next section).

## INOGENI CONTROL APP

You can use our Control App to monitor firmware information, upgrade and configure your unit.

**NOTE:** You need to use the USB-B to USB-A cable provided with the box for the Control App to detect the unit.
